behavior and design of structures

Course Description

- statics
  - physics of forces and reactions on bodies and systems
  - equilibrium (bodies at rest)
- structures
  - something made up of interdependent parts in a definite pattern of organization
- design
  - assessing and meeting structural requirements of parts and the whole

Course Description

- mechanics of materials
  - external loads and effect on deformable bodies
  - use it to answer question if structure meets
    requirements of
    - stability and equilibrium
    - strength and stiffness
  - other principle building requirements
    - economy, functionality and aesthetics
Structure Requirements

- stability & equilibrium
  - STATICS

Structure Requirements (cont)

- strength & stiffness
  - concerned with stability of components

Structural System Selection

- kind & size of loads
- building function
- soil & topology of site
- systems integration
- fire rating
- construction ($$, schedule)
- architectural form

Knowledge Required

- external forces
- internal forces
- material properties
- member cross sections
- ability of a material to resist breaking
- structural elements that resist excessive
  - deflection
  - deformation
Problem Solving

1. STATICS:
   - equilibrium of external forces, internal forces, stresses
2. GEOMETRY:
   - cross section properties, deformations and conditions of geometric fit, strains
3. MATERIAL PROPERTIES:
   - stress-strain relationship for each material obtained from testing

Relation to Architecture

“The geometry and arrangement of the load-bearing members, the use of materials, and the crafting of joints all represent opportunities for buildings to express themselves. The best buildings are not designed by architects who after resolving the formal and spatial issues, simply ask the structural engineer to make sure it doesn’t fall down.” - Onouye & Kane

Architectural Structures

• incorporates
  - stability and equilibrium
  - strength and stiffness
  - economy, functionality and aesthetics
• uses
  - sculpture
  - furniture
  - buildings

Architectural Space and Form

- evolution traced to developments in structural engineering and material technology
  - stone & masonry
  - timber
  - concrete
  - cast iron, steel
  - tensile fabrics, pneumatic structures......

Stone + Masonry

- columns
- walls
- lintels
- arches

Wood

- columns
- beams
- trusses
Steel
- cast iron – wrought iron - steel
- cables
- columns
- beams
- trusses
- frames

Concrete
- columns
- beams
- slabs
- domes

Structural Components
- bearing walls
- columns
- beams
- flat plates
- trusses
- arches
- shells
- cables

Bearing Walls
### Bearing Walls

- behavior as “deep beams”

### Beams & Plates

### Building Framing

- Components or Assemblages

(a) Common types of horizontal spanning systems (one, two, and three level systems) used in relation to different types of load-bearing wall and column vertical support systems.
Building Framing

Horizontal spanning system

Vertical support system

System Selection

- evaluation of alternatives

Structural Math

- quantify environmental loads
  - how big is it?
- evaluate geometry and angles
  - where is it?
  - what is the scale?
  - what is the size in a particular direction?
- quantify what happens in the structure
  - how big are the internal forces?
  - how big should the beam be?
Physical Math

- physics takes observable phenomena and relates the measurement with rules: *mathematical relationships*
- need
  - reference frame
  - measure of length, mass, time, direction, velocity, acceleration, work, heat, electricity, light
  - calculations & geometry

Geometric Math

- Greek architects relied on proportion
  - ratios of dimensions employed were fixed
- projective geometry
  - Renaissance
  - allowed perspective & sections
  - intersections & proportion

Basic Math

- base:
  - addition, subtraction, multiplication, division
- descriptive geometry
  - relationships existing between geometric elements such as points, lines & planes
- functions, conversions & graphs
  - relationships between quantities of numerical values
  - graphs used to avoid mental sorting and see relationships quickly

Language

- symbols for operations: +, -, /, x
- symbols for relationships: (), =, <, >
- algorithms
  - cancellation
    \[
    \frac{2}{5} \times \frac{5}{6} = \frac{2}{6} = \frac{2}{2 \times 3} = \frac{1}{3}
    \]
  - factors
  - signs
    \[
    x = \frac{1}{6} = \frac{3}{6}
    \]
  - ratios and proportions
  - power of a number
    \[
    10^3 = 1000
    \]
  - conversions, ex. \(1X = 10Y\)
    \[
    \frac{10Y}{1X} \text{ or } \frac{1X}{10Y} = 1
    \]
On-line Practice

• eCampus / Study Aids

Geometry

• shapes
  – rectangle
  – triangle
  – right triangle
  – equilateral triangle
  – rhomboid
  – parallelogram

Geometry

• angles
  – right \(= 90^\circ\)
  – acute \(< 90^\circ\)
  – obtuse \(> 90^\circ\)
  – \(\pi = 180^\circ\)

• triangles
  – area
  – hypotenuse
  – total of angles \(= 180^\circ\)

\[ AB^2 + AC^2 = BC^2 \]
Geometry

– intersection of a line with parallel lines results in identical angles

– two lines intersect in the same way, the angles are identical

Geometry

– sides of two angles are parallel and intersect opposite way, the angles are supplementary - the sum is 180°

– two angles that sum to 90° are said to be complimentary

β + γ = 90°

Geometry

– sides of two angles bisect a right angle (90°), the angles are complimentary

α + γ = 90°

– right angle bisects a straight line, remaining angles are complimentary

Geometry

– similar triangles have proportional sides

\[
\frac{AB}{AD} = \frac{AC}{AE} = \frac{BC}{DE}
\]

\[
\frac{AB}{A'B'} = \frac{AC}{A'C'} = \frac{BC}{B'C'}
\]
Trigonometry

• for right triangles

\[ \sin \alpha = \frac{\text{opposite side}}{\text{hypotenuse}} = \frac{AB}{CB} \]
\[ \cos \alpha = \frac{\text{adjacent side}}{\text{hypotenuse}} = \frac{AC}{CB} \]
\[ \tan \alpha = \frac{\text{opposite side}}{\text{adjacent side}} = \frac{AB}{AC} \]

SOHCAHTOA

Trigonometry

• for angles starting at positive x

– \( \sin \) is y side
– \( \cos \) is x side

\[ \sin \alpha = \sin \text{ value for } \theta \]
\[ \cos \alpha = \cos \text{ value for } \theta \]
\[ \tan \alpha = \tan \text{ value for } \theta \]

Trigonometry

• for all triangles

– sides A, B & C are opposite angles \( \alpha, \beta & \gamma \)

\[ \text{LAW of SINES} \]
\[ \frac{\sin \alpha}{A} = \frac{\sin \beta}{B} = \frac{\sin \gamma}{C} \]

\[ \text{LAW of COSINES} \]
\[ A^2 = B^2 + C^2 - 2BC \cos \alpha \]
Algebra

- equations (something = something)
- constants
  - real numbers or shown with a, b, c...
- unknown terms, variables
  - names like R, F, x, y
- linear equations
  - unknown terms have no exponents
- simultaneous equations
  - variable set satisfies all equations

Algebra

- solving one equations
  - only works with one variable
  - ex:
    - add to both sides
      \[2x - 1 = 0\]
      \[2x - 1 + 1 = 0 + 1\]
      \[2x = 1\]
    - divide both sides
      \[\frac{2x}{2} = \frac{1}{2}\]
      \[x = \frac{1}{2}\]
  - subtract from both sides
    \[2x - 1 - 2x = 4x + 5 - 2x\]
  - subtract from both sides
    \[-1 - 5 = 2x + 5 - 5\]
  - divide both sides
    \[\frac{-6}{2} = \frac{-3 \cdot 2}{2} = \frac{2x}{2}\]
  - get x by itself on a side
    \[x = -3\]

Algebra

- solving two equation
  - only works with two variables
  - ex:
    - look for term similarity
      \[12x - \frac{3y}{3} = 6\]
    - can we add or subtract to eliminate one term?
      \[\begin{align*}
      2x + 3y + 12x - 3y &= 8 + 6 \\
      14x &= 14 \\
      x &= 1
      \end{align*}\]
Physics for Structures

• measures
• vectors
• motion of particles
• center of mass
• equilibrium of bodies
• gravitation
• fluid mechanics
• temperature

Galileo Galilei

Physics for Structures

• measures
– US customary & SI

<table>
<thead>

Physics for Structures

• scalars – any quantity
• vectors - quantities with direction
  – like displacements
  – summation results in the “straight line path” from start to end
  – normal vector is perpendicular to something

Physics for Structures

• motion of particles
  – displacement
  – velocity
  – acceleration
  – rotation
  – cause by forces

http://www.physics.umd.edu/
Physics for Structures

• gravity
  – acceleration of mass toward the earth
  – weight or force due to gravity
• center of gravity
  – location of mass doesn’t change with motion

Physics for Structures

• equilibrium of particles – no movement

Physics for Structures

• fluid mechanics
  – weight of water or fluid causes pressure on any surface it interacts with
  – pressure is force over an area
  – air pressure causes forces
  – water pressure gets greater as it gets deeper

Physics for Structures

• temperature
  – atoms respond to heat (physical chemistry)
    • with heat solid goes to liquid goes to gas
    • excited electrons move apart
    • movement is linear
  – base 0 or freezing at the temperature water freezes at
