Shear Enjoyment 2004
Concepts

Three Stabilizing Systems
- Shear Walls
- Diagonal Bracing
- Rigid Connections

Each system provides stability in a different way. When combined, all three systems work together to provide a completely stable structure.
Shear Walls

The shear walls, used on four sides, are used in conjunction with a diaphragm provide lateral stability of the base.
The diagonal bracing creates an “X” pattern on all four vertical faces. This geometry is used to resist displacement of the frame from lateral loads.
Diagonal Bracing

Shear Enjoyment 2004
Rigid Connection

Because of the hinged connections at the top of the frame, metal braces can be connected to the top of the frame to resist torsion.
Forces

With the lateral load applied, these are the actions of the structure.
Forces

With no lateral bracing, the structure is free to rotate because there are no resisting moments.
When the shear walls are added, a diaphragm action takes place, which provides lateral stability in the base. The upper frame is still free to rotate.
Forces

The metal braces at the top of the frame keep the top connections rigid at right angles when asymmetrical loading is applied. However, the columns of the frame are still free to twist.
Once the diagonal bracing is added, the frame will be laterally stable in all directions. When all the bracing systems are added, the structure will see minimal deformation.
Construction Sequence

The shear walls and platform were constructed first.
Joel and Mark discuss where to find a saw to cut the “rails” for the shear walls.

They stumble upon a saw from Santa’s workshop.
Four holes were made in the top platform for the frame to slide into.

Jeremy is happy the base with the shear walls seems to be working.
Construction Sequence

Next, the hinged frame was put together.
Construction Sequence

Jeremy and Joel calmly demonstrate the movement of the frame.
The diagonal bracing consists of twine connected to the frame with simple loop and pin connections.
Finally, the knee braces were added to the top of the hinged frame by Joel, who wouldn’t let anyone else use the drill.
Final Testing

Our sturdy structure holds not one...

Shear Enjoyment 2004
Final Testing

Not two...

Shear Enjoyment 2004
Final Testing...

Not three...

Shear Enjoyment 2004
But Four!!!
Cost Analysis

Since we only used 10 percent of the string, the cost of the string should be 20 cents, making our total with tax $49.22.
