Moments 1  Lecture 3  Architectural Structures I  ENDS 231  F2007abn

ARCHITECTURAL STRUCTURES I:
STATICS AND STRENGTH OF MATERIALS
ENDS 231
DR. ANNE NICHOLS
FALL 2007

lecture
three

moments
Moments

- forces have the tendency to make a body rotate about an axis

- same translation but different rotation
Moments

(a) Unloaded.
(b) Loaded.

Figure 2.33  Moment on a cantilever beam.

(a)

Figure 2.34  An example of torsion on a cantilever beam.

Moments

- A force acting at a different point causes a different moment:
Moments

- defined by magnitude and direction
- units: $N \cdot m, k \cdot ft$
- direction:
  - $+ \ ccw$ (right hand rule)
  - $- \ cw$
- value found from $F$ and $\perp$ distance
  \[ M = F \cdot d \]
- $d$ also called “lever” or “moment” arm
Moments

• with same $F$:

$$M_A = F \cdot d_1 < M_A = F \cdot d_2$$

(bigger)
Moments

- additive with sign convention
- can still move the force along the line of action

\[
M_A = F \cdot d \\
M_B = F \cdot d'
\]

\[
M_A = F \cdot d \\
M_B = F \cdot d'
\]
Moments

• Varignon’s Theorem
  – resolve a force into components at a point and finding perpendicular distances
  – calculate sum of moments
  – equivalent to original moment

• makes life easier!
  – geometry
  – when component runs through point, $d=0$
Physics & Moments of a Force

- moments of a force
  - introduced in Physics as “Torque Acting on a Particle”
  - and used to satisfy rotational equilibrium
Physics and Moments of a Force

• my Physics book:

**FIGURE 11-2** The plane shown is that defined by \( \mathbf{r} \) and \( \mathbf{F} \) in Fig. 11-1. (a) The magnitude of \( \mathbf{r} \) is given by \( r_1 \) (Eq. 11-2a) or by \( r_2 \) (Eq. 11-2b). (b) Reversing \( \mathbf{F} \) reverses the direction of \( \mathbf{r} \). (c) Reversing \( \mathbf{r} \) reverses the direction of \( \mathbf{F} \). (d) Reversing \( \mathbf{F} \) and \( \mathbf{r} \) leaves the direction of \( \mathbf{r} \) unchanged. The directions of \( \mathbf{r} \) are represented by \( \bigcirc \) (perpendicularly out of the figure, the symbol representing the tip of an arrow) and by \( \otimes \) (perpendicularly into the figure, the symbol representing the tail of an arrow).
Moment Couples

- 2 forces
  - same size
  - opposite direction
  - distance $d$ apart
  - cw or ccw

\[ M = F \cdot d \]

- not dependant on point of application

\[ M = F \cdot d_1 - F \cdot d_2 \]
Moment Couples

• equivalent couples
  – same magnitude and direction
  – \( F \) & \( d \) may be different

\[ \begin{align*}
300 \text{ N} & \quad 300 \text{ N} \\
100 \text{ mm} & \\
\end{align*} \]

\[ \begin{align*}
200 \text{ N} & \quad 120 \text{ N} \\
150 \text{ mm} & \quad 250 \text{ mm} \\
\end{align*} \]
Moment Couples

• added just like moments caused by one force
• can replace two couples with a single couple

\[
\begin{align*}
300 \text{ N} & \quad 300 \text{ mm} \\
100 \text{ mm} & \quad 300 \text{ N}
\end{align*}
\]

\[
\begin{align*}
200 \text{ N} & \quad 150 \text{ mm} \\
200 \text{ N} & \quad 250 \text{ mm}
\end{align*}
\]

\[
\begin{align*}
200 \text{ N} & \quad 240 \text{ mm} \\
240 \text{ N} & \quad 240 \text{ N}
\end{align*}
\]
Moment Couples

- moment couples in structures

The flanges of a steel beam are welded to the flange of a column. Equal and opposite forces $T$ and $C$ in the beam flanges form a couple with moment $M$ that is transferred into the column.
Equivalent Force Systems

- two forces at a point is equivalent to the resultant at a point
- resultant is equivalent to two components at a point
- resultant of equal & opposite forces at a point is zero
- put equal & opposite forces at a point (sum to 0)
- transmission of a force along action line
**Force-Moment Systems**

- single force causing a moment can be replaced by the same force at a different point by providing the moment that force caused

- moments are shown as arched arrows
**Force-Moment Systems**

- A force-moment pair can be replaced by a force at another point causing the original moment.

\[
F \quad M = F \cdot d
\]
Parallel Force Systems

- forces are in the same direction
- can find resultant force
- need to find location for equivalent moments

\[ A \cdot a \quad B \cdot b \]

\[ (A + B) \cdot x \]

\[ R = A + B \]
