ARCH 331. Assignment #13

Date: 4/19/18, *due 4/26/18*   *Pass-fail work*

Problems: (none from Onouye & Kane)

(37%) 13A)   A solid one-way slab is to be used for a framing system of a one-way slab supported on beams on girders. Column spacing is 33 ft, with regularly spaced beams occurring at 11 ft center to center. (Assume the beams are 1 ft wide.) Superimposed dead load on the structure is 50 psf, and live load is 75 psf. Use f'_c = 4 ksi and f_y = 60 ksi; λ = 1. Determine the thickness for the slab and select the size and spacing for the positive and negative reinforcement to satisfy flexure requirements, and for the transverse reinforcement. Assuming there is proper bar spacing and cover, determine the minimum development lengths of the flexural reinforcement chosen. Also consider a 1 $^1/_2$ hour fire rating with a carbonate aggregate.
(frame analysis by coefficients, reinforced concrete slab design, development length)

Partial answers to check with: $V_{u\text{-}max}$ =1.4 k, ϕV_c = 4.0 k, M_{u+end} = 1.8 k-ft, M_{u+mid} = 1.5 k-ft, $M_{u\text{-}}$ = 2.1 k-ft, $A_{temp\text{-}min} \approx 0.10\ in^2$, L_d = (14.25 in. for a #3 for ex.)

(7%) 13B)   Size hollow core planks for the system and loads of problem 13A) when there are only beams at the columns (33 ft on center). Assume that the inverted T-beams the simply supported planks will be supported by are 1 ft wide in the stem. Choose the shallowest plank with the least reinforcement that will span the 32 feet while supporting the loads. Assume 2 in. of normal weight topping.   *(floor span system design)*

Partial answers to check with: estimated long term camber of 0.3 in.

(14%) 13C)   Select the minimum size square tied column and its reinforcement when the column has a dead load of 200 k, live load of 150 k, dead load bending moment of 100 k-ft, and live load bending moment of 100 k-ft. Also determine the axial capacity of the chosen column and reinforcement if ties are used. Assume f'_c = 5 ksi and f_y = 60 ksi.
(reinforced concrete column design aids)

Partial answers to check with: e = 7 in, ϕP_n = 1078 kips

(12%) 13D)   Select the minimum size round tied column and its reinforcement for the same load and bending moments of problem 13C). Also determine the axial capacity of the column and reinforcement chosen if <u>spiral</u> reinforcement is used. Assume f'_c = 5 ksi and f_y = 60 ksi.
(reinforced concrete column design aids)

Partial answers to check with: ϕP_n = 1295 kips

MORE NEXT PAGE

(30%) 13E) For a 24 in. thick 9.5 ft. square reinforced concrete footing carrying 372 kips dead load and 117 kips live load on a 22 in. square column, determine if the footing thickness is adequate for 3000 psi. A 3 in. cover is required with concrete in contact with soil. Also determine the moment for reinforced concrete design. Assume normal weight concrete, $\lambda = 1.0$.

(reinforced concrete spread footing analysis and design)

Partial answers to check with: one way: $V_u = 15.2$ k/1 ft width and OK;
two way: $V_u = 547.6$ k and OK, $M_u = 51.6$ k-ft/1 ft width

3.6 Hollow-Core Load Tables (cont.)

Strand Pattern Designation
48-S

L S = straight
L Diameter of strand in 16ths
L Number of strand (4)

Safe loads shown include dead load of 10 lb/ft² for untopped members and 15 lb/ft² for topped members. Remainder is live load. Long-time cambers include superimposed dead load but do not include live load.

Capacity of sections of other configurations are similar. For precise values, see local hollow-core manufacturer.

Key
210– Safe superimposed service load, lb/ft²
 0.3 – Estimated camber at erection, in.
 0.4 – Estimated long-time camber, in.

Strength is based on strain compatibility; bottom tension is limited to $7.5\sqrt{f'_c}$; see pages 3–8 through 3–11 for explanation.
See item 3, note 4, Section 3.3.2 for explanation of vertical line.
